[^1]Predictive Services Discussion: High pressure will build over the southern half of the U.S. bringing warmer and drier conditions. Widely scattered thunderstorms will develop over the central and southern Rockies from Colorado to southwestern New Mexico. Cooler weather will move into the Northwest while the desert Southwest remains hot and dry. Thunderstorms will develop along a front stretching from Kansas to the Great Lakes. Hot and humid weather will move into the Southeast. In Alaska, scattered showers will move across the South while widely scattered thunderstorms develop over the central and eastern Interior.

## UNFAMILIAR WITH WEATHER AND LOCAL FACTORS INFLUENCING FIRE BEHAVIOR

- Ask questions of local experts! What kinds of questions would you ask?
- Does the operational period plan give you adequate weather and information? What kinds of weather forecasts can you get? What other weather or local information do you look for in the shift plan?
- Can you get information from resources that have been on the fire? What questions will you ask of the crew that you are replacing?
- Is there any other way to obtain information? List common sources of information on weather and local factors (Examples: Web based weather Activity Planner, Point Forecast Matrix, NOAA Internet Briefing)
- To reduce risks:
- Base all actions on current and expected fire behavior.
- Post lookouts.
- Establish escape routes and safety zones.
- Take extra caution! Discuss a fire where you relied on information from the local unit (perhaps where your fire knowledge and experience was very different from how they did things-southeast or Alaska).
- Recognize and report visual indicators (clouds, WX obs., cold front passage, inversion breaking
