Predictive Services Discussion: A moist low pressure system over the state of Washington will bring more showers and thunderstorms to the northwest U.S. and northern Rockies today. Deep, monsoonal moisture over the Great Basin and central Rocky Mountains will also persist today with a chance of flash flooding. Drier air will move into California with breezy southwest winds over the higher terrain of the Sierras. Central and eastern Montana will see hot and dry conditions under a ridge of high pressure aloft. A cold front stretching from the upper Mississippi Valley to New England will bring showers and thunderstorms to the northeast U.S., while a stationary front along the Gulf Coast will produce unsettled weather for the Southeast as well.

## EXTREME FIRE BEHAVIOR 1

Weather / Fire Behavior Category

Mild, moderate and EXTREME fire behavior has always been present in cases of shelter deployment. It is critical for firefighters to maintain situational awareness of live and dead fuel moisture conditions as well as predicted and current weather conditions. As fire behavior changes, it is critical to act decisively to the changing situation.

Discuss the following indicators of extreme fire behavior:

- Relative humidity less than $15 \%$
- 1-hour fuel moisture less than $5 \%$
- Transition from surface to crown fire
- Smoldering fires that exist in the early part of the day are beginning to burn very actively as the day progresses.
- Approaching thunderheads with dark clouds beneath
- Presence of dust devils indicating an unstable atmosphere
- Increased spotting
- Sudden calm
- High clouds moving fast in direction different from surface wind
- Predicted Haines Index of 5 and 6 in those areas where this level is a good indicator of atmospheric instability
- Fire whirls
