Predictive Services Discussion: Warming and drying will develop over the West Coast and southwest U.S. Cold and wet conditions will continue in the northern Rockies as well as the eastern half of Washington, as a broad upper level low pressure system deepens over the northwest half of the U.S. Showers and thunderstorms are also forecast over the Four Corners region and High Plains, as remnants of tropical moisture stream northward. In the eastern U.S., look for a strong ridge of high pressure to bring hot temperatures to the central Plains, along with showers and thunderstorms from the Midwest through the Tennessee Valley.

Operational Engagement Category

Escape Routes are the path the firefighter takes from their current locations, exposed to the danger, to an area free from danger. Notice that escape routes is used instead of escape route(s). Unlike the other components, there always must be more than one escape route available to the firefighter.

Escape routes are probably the most elusive component of LCES. Their effectiveness changes continuously. As the firefighter works along the fire perimeter, fatigue and spatial separation increases the time required to reach the safety zone.

The most common escape route (or part of an escape route) is the fireline. On indirect or parallel fireline, situations become compounded. Unless safety zones have been identified ahead, as well as behind, firefighters retreat may not be possible.

- Have you ever timed an escape route? If not how do you judge its effectiveness?
- Describe a time when you were uncomfortably distant from your escape route.
- Describe a method you have used to communicate an escape route to your crews.
