Predictive Services Discussion: Strong southwesterly winds will develop across much of the west today, as another deep trough digs in over the northern Pacific Coast, with the strongest winds felt in the northwestern quadrant of the nation. As this trough begins its eastward progression, it will bring rain showers over far western Washington, Oregon and far northern California early in the day; and a band of wetting rainfall will move as far east as central/northern Idaho and western Wyoming by the evening and overnight. Moisture will continue to stream out of the tropics into the southwest for another day of showers and thunderstorms that are expected to make their way as far north as Wyoming, and southwesterly flow ahead of the Pacific trough will help to create a pathway for this moisture and associated thunderstorm activity to extend into the Great Lakes area. In the eastern U.S. temperatures will rise a few degrees over yesterday's highs, as a broad ridge gains amplitude. Heavy rainfall is expected for the Gulf Coast, much of the state of Florida and the southern Atlantic coast once again. The Hawaiian Islands will experience humid conditions and localized heavy rainfall due to the nearby Hurricane Ignacio.

# Chainsaw Operation, Fuel Handling \& Safety 

Felling Safety Category

Recently, several accidents and near misses involving leakage of chainsaw fuel, vapor lock/tank pressurization, and fuel spray have occurred. Firefighters should remember that fuel leakage, vapor lock/tank pressurization, and potential fuel spray can occur at any time when utilizing chainsaws. Fuel can become pressurized in any container that does not automatically vent pressure and can spray out whenever the pressure is released rapidly.

For firefighters working near ignition sources, having fuel on your clothing or skin presents a significant hazard. Personal Protective Equipment, even flame-resistant clothing, does not provide protection when fuel-soaked PPE ignites.

- Assume all gas powered equipment and fuel transport containers are pressurized! Treat them accordingly when opening, especially when near any potential ignition source.
- Chainsaw operators: Review reports associated with recent incidents (Rock Ridge Accident Investigation, Dry Creek Near Miss, Willow Peak Fire Burn Injury Rapid Lesson Sharing and others) to learn how to avoid similar occurrences. http://www.wildfirelessons.net/home
- Chainsaw operators: Watch this short safety video for information on preventing fuel leakage, identification of potential vapor lock/tank pressurization, mitigation measures for vapor lock/tank pressurization, and reporting procedures for future occurrences. https://www.youtube.com/watch?v=RG9I7YkBSOg
- Firefighters report future occurrences of vapor lock/tank pressurization, fuel spray, and fuel leakage through the Safenet System - even if no one is injured! Specific information (make/model/serial number of chainsaw, ambient air temperature, elevation, and fuel used) should be included in Safenet submissions so that further evaluation of potential safety issues can occur. http://safenet.nifc.gov/
