

**National Interagency Coordination Center
Incident Management Situation Report
Friday, April 14, 2017 – 0800 MT
National Preparedness Level 1**

National Fire Activity (Apr. 07 – Apr. 13)

Initial attack activity:	Light (993)
New large incidents:	41
Large fires contained:	28
Uncontained large fires:**	13
Area Command Teams Committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	3

**Uncontained large fires include only fires being managed under a full suppression strategy.

Southern Area (PL 3)

New fires:	654
New large incidents:	36
Uncontained large fires:	12
Type 2 IMTs committed	3

Cowbell, Big Cypress National Preserve, NPS. IMT 2 (Parrish). Thirty six miles west of Weston, FL. Tall grass, southern rough and timber. Moderate fire behavior with creeping and smoldering. Structures threatened. Area and trail closures in effect.

* **West Mims**, Okefenokee National Wildlife Refuge. Georgia IMT 2 (Kline). Sixteen miles southeast of Fargo, GA. Timber and southern rough. Active fire behavior with flanking, backing and creeping. Road closures in effect.

* **Dobson Knob**, North Carolina Forest Service. North Carolina IMT 2 (Harvell). Two miles south of North Cove, NC. Hardwood litter. Active fire behavior with backing and creeping. Structures threatened. Area and trail closures in effect.

Red Fox, National Forests in Florida. Eleven miles northeast of Lake City, FL. Southern rough. Minimal fire behavior.

* **Water Tower**, Florida Forest Service. Two miles northeast of Hernando Beach, FL. Southern rough. Minimal fire behavior.

* **Goshen Pass**, Virginia Department of Forestry. Four miles southeast of Goshen, VA. Hardwood litter. Moderate fire behavior with uphill runs.

* **Curry 11**, Florida Forest Service. Three miles southeast of Lakeport, FL. Tall grass. Minimal fire behavior.

* **Doe Knob**, National Forests in North Carolina. Five miles northeast of Shooting Creek, NC. Closed timber litter, hardwood litter and timber. Minimal fire behavior with flanking, backing and creeping. Trail closures in effect.

* **Muskrat 2**, National Forests in North Carolina. Nine miles southeast of Topton, NC. Dormant brush, hardwood slash and timber. Minimal fire behavior with creeping, backing and flanking. Area and trail closures in effect.

* **Bakers Creek**, Kentucky Division of Forestry. Started on private land ten miles west of Manchester, KY. Tall grass, medium logging slash and timber. Extreme fire behavior with wind driven and uphill runs.

* **Midway 1**, Florida Forest Service. Four miles northeast of Christmas, FL. Southern rough. Minimal fire behavior.

* **Powerline**, Florida Forest Service. Fifteen miles northeast of Dade City, FL. Southern Rough. Minimal fire behavior.

* **Bruner**, Okmulgee Field Office, BIA. Four Miles north of Lamar, OK. Hardwood litter and tall grass. Active fire behavior with creeping and smoldering. Structures threatened.

Additional wildfire information is available through the Geographic Areas at <http://gacc.nifc.gov/>

Predictive Services Discussion: Warm, dry, and periodically breezy conditions will continue across the Southwest for the next week as the region begins to enter its fire season. Tuesday and Wednesday could be periods of concern as a passing dry front significantly increases winds across Arizona and New Mexico. Looking east, Florida will remain warm and dry as drought over the region continues to intensify. Data suggests that tropically-induced convection will increase over the state late in the week, possibly bringing some moisture to critical areas, but not enough to significantly help. The northern half of the Lower 48 will remain under a cool, overall wet pattern. Low and middle elevations across the west will continue to receive intermittent rainfall that will continue to enhance the growth of fine fuels while higher elevations will see a rain/snow mix (or possibly all snow in northern areas) that will continue the slow snowpack melting rates. Looking north to Alaska, high pressure ridging over the state will keep temperatures near normal into early next week, but some cooling is expected the second half of the week as the center of the high refocuses over the Arctic Ocean and pulls in cooler air from the North Pole. The interior of the state should be mostly dry for the next week. <http://www.predictiveservices.nifc.gov/outlooks/outlooks.htm>

FIRE SHELTER DEPLOYMENT

Operational Engagement

Firefighters must never rely on fire shelters, but instead should depend on well-defined and pre-located escape routes and safety zones. However, if the need for shelter deployment should ever arise, it is imperative that the firefighter knows how to deploy and use the shelter.

- Don't think of your fire shelter as a tactical tool.
 - Recognize when deployment is your only option. When considering escape, remember that you can hold your breath for only about 15 seconds while running through flames or superheated air.
 - If time runs out while attempting to escape, get on the ground before the flame front arrives and finish deploying on the ground. Death is almost certain if the fire catches a person off the ground. (The optimal survival zone with or without a shelter is within a foot of the ground.) Once entrapped, the highest priority is to protect the lungs and airways.
 - When deploying, remove packs and place them away from the deployment area.
 - Even though deploying your shelter is a last resort, time is critical when entrapped. Play it safe; give yourself ample time to deploy. Failure to adequately anticipate the severity and timing of the burnover and failure to utilize the best location and proper deployment techniques contributed to the fatalities and injuries on the Thirty Mile incident. Don't let the cost of opening a shelter become a factor in your decision.
 - Before passing through superheated gases, try to close the front of your shroud. You can take your shelter out of the plastic bag and use it for a heat shield to pass quickly through a hot area. If you use the shelter in this way, don't drop it or allow it to snag on brush. Remember that your lungs are still vulnerable.
 - If flames contact the shelter, the glass/foil fabric heats up more rapidly. If flame contact is prolonged, spots of aluminum foil can melt or tear away, reducing protection. Even if this happens, it is still safer inside the shelter. Your flame-resistant clothing becomes your backup protection. It's even more critical to keep your nose pressed to the ground and stay in your shelter.
 - Remember, direct contact with flames or hot gases is the biggest threat to your shelter. It is vital to deploy in a spot that offers the least chance of such contact. The heavier the fuels, the bigger your fuel break needs to be.
 - Remember, once you commit yourself to the shelter, stay there. No matter how bad it gets inside, it is usually much worse outside. If you panic and leave the shelter, one breath of hot, toxic gases could damage your lungs. Suffocation may follow. Most firefighters were killed as a result of heat-damaged airways and lungs, not by external burns. Protect your airways and lungs at all costs by keeping your face close to the ground and staying in your shelter.
1. ***If your crew becomes entrapped, identify everything you and your crew/team are going to do to survive (start your discussion using pages 30-31 in your IRPG).***
 2. ***Activity: Consider having a mock fire shelter deployment exercise in realistic terrain and fuels using practice shelters (no live fire). Assess the exercise using an AAR.***
