Predictive Services Discussion: A weak trough along the central and Southern Californian coast will strengthen and begin to pull monsoonal moisture west into Nevada and central California by afternoon. Isolated to widely scattered storms are expected over the higher terrain. Elsewhere, a fast-moving cold front will move east across the Pacific Northwest and across the Northern Rockies. Breezy winds and low afternoon humidities may introduce critical fire weather conditions across eastern Montana, eastern Wyoming, and western North Dakota. Mostly dry conditions are expected across the Northeast as the previous day's system moves into the Atlantic and as another one begins to approach from the Great Lakes region. The Southeast can expect to see more scattered storms in the afternoon as a cold front stays draped across the region.

# Safety Zones 2 (LCES) 

Operational Engagement Category

Safety Zone(s) are locations where the threatened firefighter may find refuge from the danger.
Unfortunately shelter deployment sites have been incorrectly called safety zones. Safety zones should be conceptualized and planned as a location where no shelter is needed. This does not intend for the firefighter to hesitate to deploy their shelter if needed, just if a shelter is deployed the location is not a tree safety zone. Fireline intensity and safety zone topographic location determine safety zone effectiveness.

- How have you determined the distinction between a safety zone and a deployment zone?
- Is refuge in a vehicle, house an acceptable tactic?
- Consider access to the incident. You are often confronted with considerable distances of unburned fuel to cross. How do you mange LCES?
