## Predictive Services Discussion:

A large, strong, and cold low pressure system will move into the Pacific Northwest, Northern California, and the Northern Rockies bringing widespread rain and mountain snow along with breezy winds rotating counterclockwise around the low pressure area. To the south, across the southern half of the Great Basin and California, a windy southwesterly flow will develop and will create pockets of critical fire weather conditions despite having only marginally low afternoon humidity levels. The breezy flow will continue east across the Great Plains toward the Great Lakes. Meanwhile off the East Coast, Jose will continue to spin a few hundred miles off the Jersey Shore.

HAZARD TREE - NO WORK ZONES (NWZ)
Felling Safety Category

Knowing when the exact time a given hazard tree (or compromised section) will fail is an extremely difficult, and is, in many cases, an unpredictable task. Given this fact, we need to manage firefighters' exposure to these hazards by creating a safe work area or NWZ. The size and extent of the NWZ must be determined by onsite conditions, such as terrain, lean, active fire in the tree and adjoining trees.

When an identified hazardous tree cannot be felled, then perform an assessment of which areas have too high a risk, and post a lookout to warn
 the personnel to stay clear of these areas while working in adjacent areas. If hazard still exists before leaving the area, flag the NWZ so that personnel entering the area will be able to recognize the hazard. Use the following failure zone illustrations as examples to help manage firefighter exposure to these identified hazards. Also remember to include the possibility of the "Domino Effect" to surrounding trees.

Figure 1-1 1/2 X Height of snag
Figure 2-11/2 X trunk-to-branch-tip distance
Figure 3-1-1/2 X length of dead top.
