Predictive Services Discussion: The large, cold, and wet low pressure system located over southwestern Canada and the northwestern states will continue to produce very wet conditions across the Pacific Northwest, Northern Rockies, and northern Great Basin. West winds across nearly the entire West will be strong and gusty. Snow levels will continue to be located above most pass levels. Across the remainder of the Great Basin and California, expect mostly dry conditions that could create pockets of critical fire weather conditions though humidity levels will be only marginally low. Looking elsewhere, Hurricane Maria will exit Puerto Rico and move toward the Bahamas. While weakened slightly by the mountainous terrain over the island, it should remain a major hurricane. Meanwhile, tropical storm Jose will continue to produce windy conditions and possibly some beach erosion along the coast of southern New England.

Escape Routes 2 (LCES)<br>Operational Engagement Category

Escape Routes are the path the firefighter takes from their current locations, exposed to the danger, to an area free from danger. Notice that escape routes is used instead of escape route(s). Unlike the other components, there always must be more than one escape route available to the firefighter.

Escape routes are probably the most elusive component of LCES. Their effectiveness changes continuously. As the firefighter works along the fire perimeter, fatigue and spatial separation increases the time required to reach the safety zone.

The most common escape route (or part of an escape route) is the fireline. On indirect or parallel fireline, situations become compounded. Unless safety zones have been identified ahead, as well as behind, firefighters retreat may not be possible.

- Have you ever timed an escape route? If not how do you judge its effectiveness?
- Describe a time when you were uncomfortably distant from your escape route.
- Describe a method you have used to communicate an escape route to your crews.
