**Predictive Services Discussion:** The large, cold, and wet low pressure system located over southwestern Canada and the northwestern states will get a reinforcing shot of moisture and cold air as another system approaching from the Gulf of Alaska moves into the base of the system over the Pacific Northwest and merges with it. Snow levels will remain low, approximately on the midslopes. Breezy westerly winds will continue across California, the southern Great Basin, and the Four Corners region. So chances will continue in these areas for IA. By late afternoon, Maria comes into view as she moves toward the northwest to be located just southwest of the Bahamas.

## ASH PIT HAZARDS

*Miscellaneous Fireline Hazards*

Ash pits are an inherent and hidden risk to wildland firefighters that can cause severe burns and injuries. Ash pits are created when a ground fire consumes underground fuels creating an empty space that is imperceptible from the surface.

- Environmental factors that increase the risk of ash pit formation after a wildfire:
  - Extensive root systems of trees and shrubs.
  - Deep duff or peat, the organic layer covering mineral soil.
  - Landscapes that have once been cultivated or manipulated by heavy equipment, old dozer piles, sawmills, timber sale yards or decking areas.
  - Small rodent holes that have become filled with decadent combustible debris, beaver holes near dams and stream beds, badger and coyote dens.
  - White ash is sometimes an indicator of ash pits as are swarms of hovering insects.
  - With the sun behind the suspected ash pit, look for small nearly translucent smokes that dissipate quickly above the ground.
  - Ash pits often give off the smell of incomplete combustion or of creosote burning.
  
- Mitigation measures to consider:
  - Identification of high risk landscape.
  - Identify and flag all hazardous discovered ash pits.
