Predictive Services Discussion: The forecast week begins with a large, cold, and snowy upper level low pressure area positioned over the northwestern states and a warm ridge of high pressure over the eastern states. The low pressure area is beginning to add much needed snowpack to the southern Cascades and the Sierras. Snowpack across the Northern Rockies continues to add to its surplus of snow. The northern Cascades are near normal for snow and should be above normal by the end of the forecast period. This system, while moist, could bring a period of critical fire weather conditions to New Mexico and West Texas on Friday as gusty downsloping winds create dry air over areas currently experiencing drought. A second, weaker system is expected to move into the northwestern quarter of the country Saturday briefly bringing more snow. It's a fast mover, so by Saturday night it will be moving into Colorado as a third, stronger system begins to move into the Pacific Northwest from the Gulf of Alaska. This third system should take more of a southerly track as it dives south through Oregon, California, and the Great Basin. The Four Corners region could see patchy wetting rainfall Tuesday and Wednesday as the system passes. Mountains along this system's track will do well for snowfall. In case they don't, system number four arrives into the Pacific Northwest Tuesday night followed by system number five Thursday. Systems six and seven are expected the week following this,

but these might take a more northerly track across the Northwest and the Northern Rockies. For the East, there might be some localized flooding concerns along the Mississippi and Ohio River Valleys from persistent rainfall through the weekend, but that's the only noteworthy concern over the next week.

In Alaska, high pressure will produce normal to above normal temperatures and overall dry conditions through the weekend. A strong cold front should bring additional snowfall to the southern Interior on Monday before it begins to head towards the Lower 48. High pressure will return for much of the remainder of the week; however, some snow will be possible across the Interior Tuesday as a weak front passes through the high pressure ridge.

# Leadership Environment

Leadership Category

Leadership is defined as the act of influencing people in order to achieve a result. The leadership environment is made up of critical elements that a successful leader must consider in planning for effective action. Those critical elements are:

- YOU the leader, who is ultimately responsible for all action and results.
- YOUR PEOPLE those that you are responsible for.
- SITUATION comprised of the many unique variables that influence a leader's decision such as objectives, conditions, resources available, organizational influences, and others affected by the action.
- CONSEQUENCES the short and long-term effects of your actions.

Leaders constantly assess the elements of the leadership environment and adapt accordingly. Successful leaders understand the interplay of these variables and demonstrate flexibility in selecting appropriate leadership tools and techniques as a situation changes.

#### **Discussion Points:**

- Each mission has a different level risk. Discuss how the 4 leadership environment elements affect perceived risk in a changing environment.
- Each situation is unique and changes over time. Discuss what changes you might predict in your environment today.
- Discuss what leadership tools might be appropriate for those predicted changes today.
