Predictive Services Discussion: The strong high pressure ridge over the central portion of the country will flatten out and spread east as a cold front slowly moves on shore and across the Pacific Northwest. Scattered wet storms will be possible across the northern Great Basin, Oregon, and the Northern Rockies. Pockets of critical fire weather conditions will be possible across Arizona, southern Nevada, and southern Utah as breezy southwest winds encounter very low afternoon humidities. Isolated dry storms will be possible in the afternoon across West Texas and southern New Mexico. The weather along the East Coast appears to be overall warm and dry. Up in Alaska, a strong and cold low pressure area in the Gulf of Alaska will continue to pump moist and unstable air into the state's southern Interior. Expect a continuance of isolated to scattered convection along the higher terrain. The central and northern Interior will remain mostly warm and dry under the influence of a weak high pressure ridge.

Firefighter Nutrition

Firefighter Health \& First Aid

Nutrition is a critical part of the health and safety of wildland fire suppression personnel. This is the fuel for the body to perform the work and maintain cognitive abilities. Wildland firefighters on the fireline need 4,000-6,000 calories a day to not go into an energy deficit. Consider the following key points when choosing your meal:

- There are 3 major energy sources in food: carbohydrates, protein, and fats.
- Carbohydrates (also called sugar) offer an immediate source of energy for your body. They provide the fuel for your muscles and organs, such as your brain.
- Proteins are the basic building blocks of the human body. They are made up of amino acids that help build muscles, blood, skin, hair, nails and internal organs.
- Fat is an essential nutrient that provides energy, energy storage, insulation, and contour to the body.
- MTDC recommends eating 150-200 kcals every 2 hours during the work shift to maintain blood glucose and energy levels.

Carbohydrates:

- Studies on athletes have shown that carbohydrates are the most critical energy source for performance and health.
- Carbohydrates are your body's first choice for fuel. If given a choice of several types of foods simultaneously, your body will use the energy from carbohydrates first.
- If you do not eat enough carbohydrates, the following can occur:
- Fatigue
- Muscle cramps
- Poor mental function
- The fire camp lunches (called shift food) are designed to allow firefighters small amounts of food (primarily carbohydrates) that can be easily eaten throughout the work shift.

## Discussion Points:

How are you eating your fire lunch? Is it all at once or small amounts throughout the day? Think of long duration events (Ultra Runs, triathlons), do you see athletes stopping for a big meal or eating small amounts constantly throughout the race?
