**Rattlesnake Creek**, Nez Perce-Clearwater NF. IMT 2 (Almas). Five miles southwest of Riggins, ID. Timber and short grass. Moderate fire behavior with uphill runs, isolated torching and spotting. Numerous structures threatened. Road, area and trail closures in effect.

**Tenmile**, Kootenai NF. IMT 2 (Connell). Nineteen miles south of Eureka, MT. Timber. Active fire behavior with group torching, long-range spotting and short crown runs. Road, area and trail closures in effect.

\* **Medicine Man**, Yellowstone County. Eight miles north of Laurel, MT. Timber and tall grass. Active fire behavior with wind-driven runs and spotting. Numerous structures threatened

**Davis**, Kootenai NF. IMT 2 (Fry). IMT is also managing Porcupine incident. Ten miles northwest of Yaak, MT. Timber. Moderate fire behavior with single-tree torching, spotting and creeping. Structures threatened. Road, area and trail closures in effect.

**Porcupine**, Kootenai NF. Fifteen miles west of Eureka, MT. Timber. Minimal fire behavior. Road closures in effect.

**Garden Creek**, Flathead Agency, BIA. Two miles north of Ronan, MT. Timber and tall grass. Active fire behavior with group torching, single-tree torching and spotting.

**Predictive Services Discussion:** The cooler southwesterly flow will continue over much of the West; however, breezy winds and low afternoon humidity will create pockets of critical fire weather conditions inland from the coast into the northern Great Basin. Isolated dry storms will be possible across portions of southern Oregon, northern Nevada, and northern California. Widely scattered storms will be possible across Montana and the Dakotas as a cold front moves east across south central Canada. Scattered, mainly wet convection will be possible across the Four Corner's region as the monsoon continues. Breezy, Sundowner-like winds are possible tonight west of Santa Barbara. In the East, the Bermuda high will strengthen and build inland into the Southeast. A stalled frontal boundary along the Atlantic Coast will lead to scattered afternoon storms from Rhode Island south into Georgia and Florida.

## Safety Zone Research

Operational Engagement

*[If you have computer or smart phone access,  
[please watch the video for this subject](#) using the  
link or QR code...Otherwise, read on Old School...]*

First, a Fire Behavior 101 refresher: You can warm yourself around the sides of a campfire for quite some time; that's **radiant heat**. If you hold your hands over the top of the fire, you'll get burned relatively quickly; that's **convective heat**.

Basically, wind or slope can tip the flames over, so that the convective heat is no longer going straight up, but is now aimed more along the ground, sending the heat and hot gasses much further ahead. This causes pre heating of the fuels, faster fire spread and greater fire intensities. You'll need a larger Safety Zone if that fire is coming towards you.

The current equation for safety zone size in the IRPG (page 8) is:

$$4 \times \text{Flame Height} = \text{Safe Separation Distance}$$

To make estimations of flame height though, you either have to use past fire behavior observations or use your experience to guess what the fire may do in the future. After a decade of research, Bret Butler, at the Missoula Technology and Development Center, suggests removing the uncertainty and guesswork that comes with estimating flame height by taking the general rule of thumb: Flame Height = 2 x Vegetation Height

...and substituting that Flame Height equation into the original IRPG equation, to give:

$$4 \times 2 \times \text{Vegetation Height} = \text{Safe Separation Distance}, \text{ which simplified is:} \\ 8 \times \text{Vegetation Height} = \text{Safe Separation Distance}$$

But remember, that's still for **radiant heat** only, on flat ground, with no wind. To take into account the **convective heat** from slope or wind, Butler's research suggests that a "Slope Wind Factor" is needed in the equation:

$$8 \times \text{Vegetation Height} \times \text{Slope Wind Factor} = \text{Safe Separation Distance}$$

But what is the Slope Wind Factor? Current research is indicating that the Slope Wind Factor is between 1 and 10; with Butler arguing it may be closer to between 1 and 5. Butler's ongoing research is focused on answering that question by gathering sensor data on fires, running computer simulations, and refining the models...Stay tuned.

In the meantime, utilize the calculations on page 8 of your IRGP to help you determine a bare minimum size for your safety zone with the understanding that slope and wind need to be considered in your decision making.

But remember, a safety zone is only good if you can get there...join us tomorrow for some thoughts on Escape Routes.
