

**National Interagency Coordination Center
Incident Management Situation Report
Friday, February 8, 2019 – 0800 MT
National Preparedness Level 1**

National Fire Activity

Initial Attack Activity:	Light (291) new fires
New large incidents:	6
Large fires contained:	4
Uncontained large fires:**	2
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	0

**Uncontained large fires include only fires being managed under a full suppression strategy.

Southern Area (PL 1)

New fires:	267
New large incidents:	6
Uncontained large fires:	2

* **Haggred**, Texas A & M Forest Service. Ten miles west of Miami, TX. Tall grass. Active fire behavior with wind driven runs. Structures threatened.

* **Pine Mtn. West**, East Central Area, Oklahoma DOF. Forty-two miles southwest of Fort Smith, Arkansas. Timber. Minimal fire behavior with backing and wind driven runs.

***Additional wildfire information is available through the Geographic Areas at <http://gacc.nifc.gov/>

Predictive Service Discussion: A pair of strong, moist systems will approach the coasts of northern California and Oregon on Friday and spread additional snow and rain into the western states from the Bay Area north to the Canadian Border Friday and Saturday. Snow levels will be down to the valley floors in most areas except across southern portions of northern California where they will be slightly higher. The southerly system will merge with the one off the Oregon Coast on Saturday as cold air is drawn down from Canada. Significant snowfall is possible across the entire northwestern portion of the country Sunday as the system begins to move east. Critical fire weather conditions will be possible across New Mexico and West Texas on Monday as windy, dry conditions develop along the southern edge of the passing system. A secondary Arctic front will drop south and east across the Northern Rockies and northern Great Plains on Wednesday and will reinforce the cold air mass that is already in place. Elsewhere across the country during the outlook period, no significant concerns exist.

Hazard Tree – No Work Zones (NWZ)

Felling Safety Category

Knowing when the exact time a given hazard tree (or compromised section) will fail is an extremely difficult, and is, in many cases, an unpredictable task. Given this fact, we need to manage firefighters' exposure to these hazards by creating a safe work area or No Work Zone (NWZ). The size and extent of the NWZ must be determined by onsite conditions, such as terrain, stand structure, and fire impacts to the tree and adjoining trees.

When an identified hazardous tree or trees cannot be felled, then perform an assessment of which areas have too high a risk, and post a lookout to warn the personnel to stay clear of these areas while working in adjacent areas. If hazard still exists before leaving the area, flag the NWZ so that personnel entering the area will be able to recognize the hazard. Use the following failure zone illustrations as examples to help manage firefighter exposure to these identified hazards. Also remember to include the possibility of the “Domino Effect” to surrounding trees.

Figure 1 – 1 1/2 X Height of snag

Figure 2 – 1 1/2 X trunk-to-branch-tip distance

Figure 3 - 1-1/2 X length of dead top.
