#### National Interagency Coordination Center Incident Management Situation Report Wednesday, October 30, 2019 – 0800 MT National Preparedness Level 2

# **National Fire Activity**

Initial attack activity:	Light (46 new fires)
New large incidents:	1
Large fires contained:	2
Uncontained large fires:***	8
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	1
Type 2 IMTs committed:	0

Nationally, there are 6 large fires being managed under a strategy other than full suppression. \*\*\* Uncontained large fires include only fires being managed under a full suppression strategy.

### Northern California Area (PL 3)

New fires:	28
New large incidents:	0
Uncontained large fires:	3
Type 1 IMTs committed:	1

**Kincade**, Sonoma-Lake Napa Unit, Cal Fire. IMT 1 (Cal Fire Team 6). Ten miles northeast of Geyserville, CA. Timber, chaparral and short grass. Active fire behavior with backing and flanking. Several communities and energy infrastructure threatened. Evacuations, area and road closures in effect.

**Burris**, Mendocino Unit, Cal Fire. Four miles south of Potter Valley, CA. Chaparral and tall grass. Moderate fire behavior with smoldering. Structures threatened.

**Caples**, Eldorado NF, USFS. Eighteen miles southwest of South Lake Tahoe, CA. Timber and brush. Minimal fire behavior with creeping, backing and smoldering. Area and trail closures in effect.

Prescribed Fires and Acres Yesterday (by Ownership):

\*\*\*Prescribed fire acres are for reference only and may not reflect the most up-to-date information. \*\*\*Official prescribed fire accomplishment reporting occurs through agency specific systems of record.

**Predictive Services Discussion:** The current Foehn Wind episode will reach it's peak today across California. Expect very windy conditions and single digit humidities in prone areas. Winds will continue through the overnight period. High pressure along the West Coast will move on shore and inland by afternoon. This will allow for continued dry conditions. Middle and upper elevations and also coastal areas will see temperatures that are well above average. However, the lower valleys and basins will likely see the development of strong valley temperature inversions. A breezy northwesterly flow will continue across the Great Plains in the wake of a passing cold front that should cross the Mississippi River around mid-day. As it does so, moisture from the Gulf of Mexico will be drawn north and should bring wetting rainfall to both the Appalachian Mountains and areas east. Widespread significant fire weather concerns are not expected today.

# **Fire Shelter Deployment Site Selection**

**Operational Engagement Category** 

A primary objective of every operational fire plan is to keep firefighters out of entrapment situations. However, firefighters must always be prepared to deploy their fire shelters. The key to a successful fire shelter deployment is proper site selection. Consider the following when discussing shelter deployment site selection.

- Pick a site that will keep the fire shelter away from flames and convective heat. The site also should limit the amount of radiant heat that reaches the shelter.
- Select an area with no fuels. If that isn't possible, select a site in light fuels, such as grass, where the flaming front will pass quickly. Clear the site to mineral soil if at all possible. If time is critical, pick a site with the least fuel.
- Pick natural firebreaks (such as wet meadows; creek beds; wet, swampy areas; large rockslides with no fuels). Rough terrain in rockslides may make it difficult to seal the fire shelter to the ground.
- Areas on the lee side of ridgetops and knobs can be effective deployment sites because convective heat and flames will generally continue rising above them.
- Wide areas that have been cleared of fuel, such as dozer lines or roads, can be effective deployment sites. In larger areas, don't let trucks, dozers, and other equipment occupy the best deployment sites.
- Flat areas on slopes, such as benches or road cuts, offer some protection from radiant and convective heat. Level areas like these can keep you under the path of flames and convective heat.
  - The ditch on the inside of the road, if free of fuel may be an effective deployment site on a road.
  - Consider vehicle traffic.
- Avoid areas that tend to funnel smoke, flames and hot gasses, such as:
  - Narrow draws
  - Saddles on ridgetops
  - Chimneys and chutes
- Know how long it takes to reach your safety zone. Crew supervisors should identify and communicate escape routes and safety zones.
- If you're not in a suitable shelter deployment area, keep escaping while watching for a possible deployment site.
- Ensure sites are clearly identified and marked.
