

**National Interagency Coordination Center
Incident Management Situation Report
Tuesday, August 4, 2020 – 0730 MDT
National Preparedness Level 4**

National Fire Activity:

Initial attack activity:	Light (125 new fires)
New large incidents:	8
Large fires contained:	4
Uncontained large fires:***	37
Area Command teams committed:	0
NIMOs committed:	1
Type 1 IMTs committed:	1
Type 2 IMTs committed:	8

Nationally, there are 14 large fires being managed under a strategy other than full suppression.

***Uncontained large fires include only fires being managed under a full suppression strategy.

***Official prescribed fire accomplishment reporting occurs through agency specific systems of record.

Canadian Fires and Hectares

PROVINCES	FIRES YESTERDAY	HECTARES YESTERDAY	FIRES YEAR-TO-DATE	HECTARES YEAR-TO- DATE
BRITISH COLUMBIA	20	36	341	799
YUKON TERRITORY	0	0	21	15,136
ALBERTA	6	1	441	753,617
NORTHWEST TERRITORY	3	8	66	19,611
SASKATCHEWAN	2	0	97	42,060
MANITOBA	0	0	110	49,408
ONTARIO	2	0	465	6,192
QUEBEC	0	0	633	67,827
NEWFOUNDLAND	1	0	60	2,080
NEW BRUNSWICK	1	3	329	1,142
NOVA SCOTIA	0	0	121	654
PRINCE EDWARD ISLAND	0	0	10	8
NATIONAL PARKS	2	0	48	1,655
TOTALS	37	48	2,742	960,187

*1 Hectare = 2.47 Acres

Predictive Services Discussion: Upper-level troughing will develop just offshore the California coast with the upper high over the Southwest. This will reduce thunderstorm activity in the Southwest as the moisture shifts eastward over the Plains where scattered to widespread thunderstorms are expected. Isolated dry thunderstorms are possible over portions of northern California, southern/central Oregon, and northern Nevada as well. Dry and windy conditions are expected over northeast Utah and southern Wyoming and southern with hot, dry, and breezy conditions in the southern Great Basin and Desert Southwest. A cold front will continue pushing southward across the Plains and Lower Mississippi Valley and eastward through the Ohio and Tennessee Valleys. Isaias will move over eastern North Carolina and Delmarva with tropical storm conditions expected and heavy rain likely across much of the Mid-Atlantic and Northeast. Rain is likely across much of the southern Alaska coast with scattered storms over the interior.

Safety Zone Research

Operational Engagement

[If you have a computer or smartphone access, [please watch the video for this subject](#) using the link or QR code... Otherwise, read on Old School...]

First, a Fire Behavior 101 refresher: You can warm yourself around the sides of a campfire for quite some time; that's **radiant heat**. If you hold your hands over the top of the fire, you'll get burned relatively quick; that's **convective heat**.

Basically, wind or slope can tip the flames over, so that the convective heat is no longer going straight up, but is now aimed more along the ground, sending the heat and hot gasses much further ahead. This causes preheating of the fuels, faster fire spread, and greater fire intensities. You'll need a larger Safety Zone if that fire is coming towards you.

The current equation for safety zone size, in the Safety Zone section (green) of the *Incident Response Pocket Guide (IRPG)*, PMS 461, is:

$$4 \times \text{Flame Height} = \text{Safe Separation Distance}$$

To make estimations of flame height though, you either have to use past fire behavior observations or use your experience to guess what the fire may do in the future. After a decade of research, Bret Butler, at the Missoula Technology and Development Center, suggests removing the uncertainty and guesswork that comes with estimating flame height by taking the general rule of thumb: Flame Height = 2 x Vegetation Height

...and substituting that Flame Height equation into the original IRPG equation, to give:

$$4 \times 2 \times \text{Vegetation Height} = \text{Safe Separation Distance, which simplified is:} \\ 8 \times \text{Vegetation Height} = \text{Safe Separation Distance}$$

But remember, that's still for **radiant heat** only, on flat ground, with no wind. To take into account the **convective heat** from slope or wind, Butler's research suggests that a "Slope Wind Factor" is needed in the equation:

$$8 \times \text{Vegetation Height} \times \text{Slope Wind Factor} = \text{Safe Separation Distance}$$

But what is the Slope Wind Factor? Current research is indicating that the Slope Wind Factor is between 1 and 10; with Butler arguing it may be closer to between 1 and 5. Butler's ongoing research is focused on answering that question by gathering sensor data on fires, running computer simulations, and refining the models...stay tuned.

In the meantime, utilize the calculations in the Safety Zone section (green) of your IRPG to help you determine a bare minimum size for your safety zone with the understanding that slope and wind need to be considered in your decision making.

Above all, remember, a safety zone is only good if you can get there.
