Predictive Services Discussion: A cold front will push through the northern Plains with a stalled-out surface front stretching across northern Utah into northern California. Another Pacific cold front will move into the Pacific Northwest. Dry and breezy post-frontal conditions will continue in portions of southern Idaho and southwest/central/northern Montana. Thunderstorms are expected to develop over the northern and central Plains and into the Great Lakes ahead of the cold front. Showers and thunderstorms are also likely near a surface front moving through the Southeast and Mid-Atlantic. Isolated to widely scattered thunderstorms will remain possible over far eastern Arizona, much of New Mexico, and into southern Colorado. More rain is expected along the Alaska coast with isolated to scattered coverage in the interior.

Wildland/Urban Interface Watch Outs
Operational Engagement Category

The primary consideration is to first assure firefighter and public safety. It is a must to assess potential fire behavior, ingress/egress routes, nature of the threat, hazardous materials, and available water supplies before engaging in the protection of any structures. The first step in conducting a safe operation is to assess whether firefighting operations can be conducted safely.

## Consider the "Wildland/Urban Interface Watch Outs" in completing a risk analysis for the urban interface area to be protected. Remember there are three categories of structures:

- Those that are not threatened.
- Those that are threatened.
- Those that have already been lost or too dangerous to protect.

## Wildland/Urban Interface Watch Outs:

- Poor access and narrow, one-way roads. A rapidly spreading fire could trap apparatus and personnel before they can turn around or move away from the flames and smoke.
- Observe bridge limits. Exceeding bridge limits could lead to bridge failure with a resultant blocking of ingress/egress routes that could result in the loss of an escape route or loss of equipment.
- Inadequate water supply. Without a reserve supply of water, the fire can overtake an area before the fuels can be cleared away.
- Natural fuels are located 30 feet or closer to structures on level ground. Remember structures on slopes require greater clearance. Structures are located on canyon slopes or "chimneys" on slopes of $30 \%$ or more with continuous, flashy fuels. The resulting rate of spread of any fire in this terrain can quickly extend beyond control.
- Extreme fire behavior:
- Situations involving crowning, large flame heights, and erratic fire behavior can extend in an unpredictable manner beyond the control of any number of personnel.
- Strong winds of $25+$ miles per hour: Winds increase the chance of spotting over the heads of firefighters and trapping them between both fire areas. Winds also cause greater preheating of fuels in the path of a fire front.
- The need to evacuate the public, livestock, pets, and/or animals. This critical activity can pull personnel from the firefighting activity and can distract attention from fire behavior at a time when the greatest alertness is needed.
- Propane and above ground fuel tanks that are next to wooden structures or close to vegetation.
- Power lines and poles:
- What is their location in relation to the structures that are being protected? Watch for both overhead and downed power lines.
- Local citizens are attempting suppression activities. Lack of knowledge in fire suppression may lead to unsafe tactics.
- Airtanker retardant drops and helicopter bucket operations:
- Establish communications and keep fire personnel out of the drop zone.
