Predictive Services Discussion: Another weather disturbance will move through the northwestern US bringing another round of widespread precipitation to Washington, Oregon, central/northern Idaho, Montana, and western Wyoming. These areas will also see gusty westerly winds, though relative humidity will be above critical values and critical fire weather conditions are not expected. High pressure building over Southern California will bring slightly warmer and drier conditions to the Southwest.

Escape Routes 2

Escape Routes are the path the firefighter takes from their current locations - when exposed to danger - to an area free from danger. Notice that escape routes is used instead of escape route(s). Unlike the other components, there always must be more than one escape route available to the firefighter.

Escape routes are probably the most elusive component of LCES. Their effectiveness changes continuously. As the firefighter works along the fire perimeter, fatigue and spatial separation increase the time required to reach the safety zone.

The most common escape route (or part of an escape route) is the fireline. On an indirect or parallel fireline, situations become compounded. Unless safety zones have been identified ahead, as well as behind, firefighters retreat may not be possible.

- Have you ever timed an escape route? If not, how do you judge its effectiveness?
- Describe a time when you were uncomfortably distant from your escape route.
- Describe a method you have used to communicate an escape route to your crews.
