

**National Interagency Coordination Center
Incident Management Situation Report
Friday, November 27, 2020 – 0800 MDT
National Preparedness Level 1**

National Fire Activity (November 20 – November 26, 2020):

Initial attack activity:	Light (282 new fires)
New large incidents:	8
Large fires contained:	19
Uncontained large fires:***	4
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	0

Nationally, there are 3 fires being managed under a strategy other than full suppression.

***Uncontained large fires include only fires being managed under a full suppression strategy.

[Link](#) to Geographic Area daily reports.

[Link](#) to Understanding the IMSR.

This report will post every Friday at 0800 Mountain Time unless significant activity occurs.

Active Incident Resource Summary						
GACC	Incidents	Cumulative Acres	Crews	Engines	Helicopters	Total Personnel

Southern California Area (PL 2)

New fires: 64
 New large incidents: 0
 Uncontained large fires: 2

Creek, Sierra NF, USFS. Transfer of command from IMT 2 (CA Team 10) back to the local unit occurred on 11/21. Thirty-five miles northeast of Clovis, CA. Timber, brush and litter. Minimal fire behavior with creeping and smoldering. Area, road and trail closures in effect.

SQF Complex, Sequoia NF, USFS. Thirty-three miles east of Porterville, CA. Timber and chaparral. Minimal fire behavior. Area, road and trail closures in effect.

Safety Zone Research

Operational Engagement

[If you have a computer or smartphone access, [please watch the video for this subject](#) using the link or QR code... Otherwise, read on Old School...]

First, a Fire Behavior 101 refresher: You can warm yourself around the sides of a campfire for quite some time; that's **radiant heat**. If you hold your hands over the top of the fire, you'll get burned relatively quick; that's **convective heat**.

Basically, wind or slope can tip the flames over, so that the convective heat is no longer going straight up, but is now aimed more along the ground, sending the heat and hot gasses much further ahead. This causes preheating of the fuels, faster fire spread, and greater fire intensities. You'll need a larger Safety Zone if that fire is coming towards you.

The current equation for safety zone size, in the Safety Zone section (green) of the *Incident Response Pocket Guide (IRPG)*, PMS 461, is:

$$4 \times \text{Flame Height} = \text{Safe Separation Distance}$$

To make estimations of flame height though, you either have to use past fire behavior observations or use your experience to guess what the fire may do in the future. After a decade of research, Bret Butler, at the Missoula Technology and Development Center, suggests removing the uncertainty and guesswork that comes with estimating flame height by taking the general rule of thumb: Flame Height = 2 x Vegetation Height

...and substituting that Flame Height equation into the original IRPG equation, to give:

$$4 \times 2 \times \text{Vegetation Height} = \text{Safe Separation Distance}, \text{ which simplified is:}$$
$$8 \times \text{Vegetation Height} = \text{Safe Separation Distance}$$

But remember, that's still for **radiant heat** only, on flat ground, with no wind. To take into account the **convective heat** from slope or wind, Butler's research suggests that a "Slope Wind Factor" is needed in the equation:

$$8 \times \text{Vegetation Height} \times \text{Slope Wind Factor} = \text{Safe Separation Distance}$$

But what is the Slope Wind Factor? Current research is indicating that the Slope Wind Factor is between 1 and 10; with Butler arguing it may be closer to between 1 and 5. Butler's ongoing research is focused on answering that question by gathering sensor data on fires, running computer simulations, and refining the models...stay tuned.

In the meantime, utilize the calculations in the Safety Zone section (green) of your IRPG to help you determine a bare minimum size for your safety zone with the understanding that slope and wind need to be considered in your decision making.

Above all, remember, a safety zone is only good if you can get there.
