Predictive Services Discussion: An upper high will remain over southern California today with short-wave ridging extending northward over the Sierra, western Great Basin, and into the inland Pacific Northwest and Northern Rockies. Above normal temperatures are forecast along with minimum relative humidity in the single digits and teens. Dry and breezy conditions are likely across the gaps of the Coast Ranges of California, the Sierra, and Cascades with a stronger onshore pressure gradient. Enough moisture will remain for isolated to scattered mixed wet and dry thunderstorms in portions of eastern Oregon into west central Idaho. Wetter more widespread thunderstorms are expected across the Front Range of the Rockies into the adjacent High Plains with flash flooding possible in portions of Colorado and New Mexico. Upper ridging over Alaska will bring much above normal, near record-setting temperatures to much of the central part of the state.

# Hazard Tree Secure Felling Area 

Felling Safety Category

The following fundamental safety principles for tree felling operations have been established based on repeated lessons learned following serious accidents. To protect sawyers, swampers, and operational personnel from exposure to potential traumatic injury or death during tree felling operations, the following safety procedures should be applied to all felling activities. Fireline supervisors should continue to monitor all felling operations to ensure the following safe job procedures are consistently applied:

- A secure felling area, MINIMUM OF TWO AND ONE HALF (2.5) TIMES THE HEIGHT OF THE MATERIAL BEING FELLED IN ALL DIRECTIONS, needs to be established and maintained by the faller during all tree felling operations. In addition, the entire downhill side on slopes must be secured if materials can fall/role for a long, unpredictable distance.
- No one shall be permitted in the secured felling area without the authorization of the faller.
- The faller shall establish a safety zone outside the secured area and direct EVERYONE to remain there until all felling is completed and an "all clear" has been communicated.
- Safety zones should be established, whenever practical, in the opposite direction of the planned fall, and at a distance of at least 2.5 times the height of the trees being felled.
- The faller shall assign lookout(s). The lookout(s) shall have reliable communications with the faller, and other personnel adjacent to the secure areas.
- Competent lookouts shall be established and maintained by the faller at all major access points of roads and trails that afford access to the secured felling area.
- The faller will ensure that no hazards remain such as hang-ups, unstable logs, or other dangers before approving access or leaving the secured area.
