Predictive Services Discussion: An upper low will move into British Columbia with westerly flow aloft over the northern half of the West. A cold front will push south through the Great Lakes as an upper low moves north of the Great Lakes. Hurricane Ida will make landfall as a major hurricane on the southeast Louisiana coast. Tropical storm to hurricane conditions are likely for much of southeast Louisiana into southern Mississippi, including New Orleans. Dry and breezy conditions are likely in the Cascade gaps, along the Sierra Front, and across western and northern portions of the Great Basin into Wyoming. Dry and breezy conditions are also possible along eastern slopes and gaps in the Coast Ranges of California. Dry and breezy post-frontal conditions are likely for Minnesota into the Upper Peninsula of Michigan, but recent rainfall will help mitigate fire potential, including lingering morning showers. Moisture will be scoured out of most the West except for portions of the Southwest into southern California and along and east of the Divide in Colorado where isolated to scattered monsoon thunderstorms are likely. Isolated thunderstorms may also develop over the higher terrain in portions of far southern California. Showers and thunderstorms are likely in portions of the Midwest and Great Lakes into the Mid-Atlantic and Northeast as the cold front pushes south and east.

## EXTREME FIRE BEHAVIOR - I

Weather - Fire Behavior Category

Changes in fire behavior have always been present in cases of shelter deployment. It is critical for firefighters to maintain situation awareness of live and dead fuel moisture conditions, as well as predicted and current weather conditions. As fire behavior moves from mild to moderate to extreme, it is critical to act decisively regarding the changing situation.

Discuss the following indicators of extreme fire behavior:

- Relative humidity less than $15 \%$.
- 1-hour fuel moisture less than $5 \%$.
- Transition from surface to crown fire.
- Smoldering fires that exist in the early part of the day are beginning to burn very actively as the day progresses.
- Approaching thunderheads with dark clouds beneath.
- Presence of dust devils indicating atmospheric instability.
- Increased spotting.
- Sudden calm.
- High clouds moving fast in a direction that is different from surface wind.
- Predicted Haines Index of 5 and 6 in those areas where this level is a good indicator of atmospheric instability.
- Fire whirls.
