# National Interagency Coordination Center Incident Management Situation Report Monday, August 8, 2022 - 0730 MDT National Preparedness Level 3 

## National Fire Activity:

Initial attack activity:
Light (85 fires)
New large incidents:2
Large fires contained: ..... 5
Uncontained large fires: ** ..... 35
Area Command teams committed: ..... 0
NIMOs committed: ..... 1
Type 1 IMTs committed: ..... 3
Type 2 IMTs committed: ..... 9
***Complex IMTs committed:
***Complex Incident Management Teams (CIMTs) are configured to respond to large, complex fires and can expand and reduce staffing in all functional areas as necessary to meet the needs of the incident.

Nationally, there are 61 fires being managed under a strategy other than full suppression.
**Uncontained large fires include only fires being managed under a full suppression strategy.
Link to Geographic Area daily reports.
Link to Understanding the IMSR.
One RC-26 aircraft with Distributed Real-Time Infrared (DRTI) capability and support personnel from the 141st Air Refueling Wing (Washington Air National Guard) have been deployed to Boise, ID. One RC-26 aircraft with Distributed Real-Time Infrared (DRTI) capability and support personnel from the 162nd Operations Group (Arizona Air National Guard) have been deployed to Eugene, OR in support of wildland fire operations.

Predictive Services Discussion: Hot temperatures of $90-105^{\circ} \mathrm{F}$ with low afternoon relative humidity of $7-20 \%$ are forecast over much of the Inland Northwest into Idaho and western Montana this afternoon. Isolated to scattered mainly dry thunderstorms will develop across far northeast California into south-central and southeast Oregon. Isolated dry thunderstorms are likely to continue overnight in the Oregon Cascades into the Willamette Valley. South winds of 10 to 20 mph with gusts to 35 mph will create areas of elevated fire weather conditions across northwest California as well. Scattered wet monsoonal thunderstorms will develop across the Southwest, southeast California, and western Nevada this afternoon and evening.

Hot temperatures in the 90s are forecast for southern New England and the Mid-Atlantic with dry conditions, but winds will be light with relative humidity above $35 \%$. Scattered showers and thunderstorms will develop ahead of a cold front from the Texas Panhandle through Oklahoma, the Mid-Mississippi, and Ohio Valleys into the eastern Great Lakes. Scattered wet thunderstorms will develop across the Southeast as well.

Propane Tank Safety
Miscellaneous Fireline Hazards Category

Liquefied Propane Gas (LPG) tanks are commonly found in the wildland urban interface and present hazards to firefighters in that environment. LPG tanks may be found around motor homes, travel trailers, grills, camp stoves, lanterns, etc. Directly attacking LPG tank fires is a structural fire task involving hazardous materials and should only be attempted by trained personnel using full structural personal protective equipment and equipped with a volume of water adequate to safely attack the fire.

## Boiling Liquid Expanding Vapor Explosions (BLEVE)

- The most recognized hazard with LPG tanks is BLEVE or sudden complete failure of the tank. Some training courses have directed responders to approach the tank from the sides, believing that the force of the explosion will occur on the ends of the tank. However, this is not a guarantee that you will be safe from projectiles or missiles from the explosion as they may travel in all directions up to 2,500 feet away. Leave the area immediately if you smell propane, hear a rising sound from venting safety devices, or see discoloration or deformation of the tank. Move at least 2,500 feet away, and do not go downwind or downslope of the leaking propane. BLEVEs are a major hazard to emergency responders!

## Fuel Reduction Around Tanks

- Wildland firefighters may take action to prevent direct flame impingement on LPG tanks by removing wildland fuels in the area. However, be aware that lines from the tank to structures may be above or below ground and may be cut by tools or equipment. Propane gas is heavier than air. It may move along the ground at some distance and may ignite when in reaches open flame or another ignition source. Use extreme caution when doing fuels reduction around tanks and flag any lines you encounter.

## Other Wildland Fire Considerations

- Do not position engines or other apparatus near LPG tanks or downwind/downslope from tanks.
- Do not deploy fire shelters near LPG tanks or downwind or downslope from tanks.

## Cooling Tanks

- In light fuels such as grasses, where any heat exposure to the tank will be very limited, the rapid application of cooling water on the outside of the tank above the liquid level can reduce the likelihood of container failure by lowering the external temperature of the shell of the exposed tank. Water should not be directed at the valve safety devices, due to the potential of icing the valve closed.
- In heavy fuels where long duration heat exposure to the LPG tank is likely, evacuate all personnel and equipment to 2,500 feet away and not downwind or downslope. The National Fire Protection Association (NFPA) says that direct flame impingement protection requires water flow of at least 500 gallons per minute from an unmanned monitor nozzle. This is a situation for properly trained, equipped, and supported structural firefighters.
